

**slider
by alligator**

welcome to slider

a simple slideshow creator

here's how it works

a slideshow is a text file

one line is one slide

**slider reads this
and turns it into a PDF**

**long lines of text
automatically wrap**

**or you can
put newlines
in slides
using \n
if you want**

**lines starting with # are
ignored**

**it supports formatting
options**

! is monospace

< is left aligned

- is small

**you can
combine them
too**

combining all three works
well for code

```
if (thing) {  
    printf("hello\n");  
}
```

**it has some command line
arguments**

-d is dark mode

**you're seeing dark mode
right now**

dark mode = white on black

light mode = black on white
(this is the default)

-4 is 4:3 mode

**this outputs slides in a 4:3
aspect ratio**

**in case you're presenting
on a projector from 2002**

**slider is designed to be
simple**

simple = less decisions

simple = less decisions

less decisions = focus

simple = less decisions

less decisions = focus

focus = good presentations

technical details

written in C

**30kb standalone executable
windows, OSX and linux**

options

-d dark mode

-4 4:3 mode

format codes

! monospace

< left aligned

- small text
